

CONSTRUCTION OS

PRD_7

Platform Admin Dashboard and Platform Governance

Additive Product Requirements Document

Version 1.0

3 August 2026

Prepared for Senior Full-Stack Development, DevOps, Security, QA and Product Teams

Document Status and Compatibility

Compatibility rule

PRD_7 extends PRD_1 through PRD_6. It does not replace company-level permissions, role dashboards, task orchestration, public sign-up, document control or tenant-isolation rules. Where PRD_7 refers to those features, the earlier requirements remain authoritative unless this document explicitly states a confirmed correction.

Field	Value
Document	Construction OS - PRD_7 - Platform Admin Dashboard and Platform Governance
Status	Developer handoff / approved product direction
Primary audience	Full-stack developers, DevOps, security engineers, QA, product and platform operations
Scope	Platform-level administration across companies, public profiles, subscriptions, support, deletion, recovery, moderation and system operations
Out of scope	Normal Company Admin operations inside a tenant, except where Platform Admin must review or support them
Data ownership	Each company owns its company data. Platform administration does not grant routine access to tenant business records.

Contents

- Executive purpose
- Platform Admin principles
- Platform Admin roles and separation of duties
- Dashboard information architecture
- Global dashboard overview
- Company and tenant administration
- Company application and verification
- Company Owner protection and recovery
- Company deletion governance
- Professional and contractor application review
- Subscription, licensing and module control
- Billing and usage oversight
- Support-access governance
- Platform security and tenant isolation
- Audit, archive and evidence
- Public network and content moderation
- Tender, jobs and opportunity governance
- Trust, verification and duplicate control
- Integration administration
- Notifications and escalation
- Platform health and operational monitoring
- Search and cross-platform navigation
- Platform Admin record pages
- Required data model
- Suggested APIs and services
- Permission matrix
- Security controls
- Non-functional requirements
- Acceptance criteria
- Open decisions and future phases

1. Executive Purpose

The Platform Admin Dashboard is the control center for operating Construction OS as a multi-company SaaS platform. It must allow authorized platform personnel to manage company tenants, public professional and contractor applications, subscriptions, verification, support sessions, owner recovery, company deletion, platform moderation, system health and platform-level audit evidence without turning Platform Admin into a routine participant inside customer company operations.

Primary boundary

Platform Admin manages the platform. Company Owner and Company Admin manage their company. Platform Admin must not receive general access to a company's projects, Finance, HR, Legal, contracts, documents or employee records merely because they operate the platform.

2. Platform Admin Principles

- Deny tenant-data access by default.
- Every platform-level action must be attributable to a specific Platform Admin account.
- Platform-level privileges must be explicit, least-privilege and role-based.
- Company Owner remains the highest authority inside the company tenant.
- Platform Admin can recover a Company Owner account only after strict identity verification and without gaining company-data access.
- Company deletion requires the Company Owner request, a seven-day read-only standby period and manual Platform Admin approval.
- Company data, files, databases and backups are deleted only after final Platform Admin approval; deletion is never automatic at the end of standby.
- Public professional and contractor profiles require Platform Admin approval before activation.
- Company support access is temporary, scoped, company-approved, time-limited and fully logged.
- No cross-company data leakage is permitted in search, analytics, logs, support or administration.

3. Platform Admin Roles and Separation of Duties

The platform should support multiple Platform Admin role profiles. One individual may hold more than one role, but the permission engine must evaluate each privilege explicitly.

Platform role	Primary responsibilities	Tenant business-data access
Platform Super Admin	Manage platform administrators, global settings, security policy, plans, emergency controls and final escalations	None by default
Company Operations Admin	Review company applications, verification, suspension, tenant status and deletion requests	None by default
Application Reviewer	Review professional and contractor profiles, documents and requested changes	Only submitted public-profile application data
Billing Admin	Plans, subscriptions, invoices, usage, storage and module entitlements	Billing metadata only
Support Admin	Support requests and approved support sessions	Only within approved, scoped and active support session

Platform role	Primary responsibilities	Tenant business-data access
Trust & Safety Admin	Public profiles, network content, tenders, jobs, abuse reports and suspensions	Public/network content and submitted evidence only
Technical Operations Admin	System health, jobs, queues, webhooks, integration failures, backups and incidents	Operational metadata; no tenant record content by default
Security Auditor	Platform audit, privileged actions, access events and security reports	Audit metadata; content access only when separately authorized by policy

4. Dashboard Information Architecture

The Platform Admin interface must be visually and technically separate from company dashboards. It must not use a Company Owner, Company Admin, Finance, Sales, Architecture or other tenant role shell.

Primary navigation	Core pages
Overview	Platform KPIs, queues, risks, incidents, pending decisions
Companies	Company directory, applications, verification, status, subscription, owner and tenant configuration
Applications	Professional applications, contractor applications, changes requested, rejected and approved
Subscriptions	Plans, modules, licensed users, storage, AI usage, invoices and exceptions
Support Access	Requests, active sessions, scopes, expiration, session log and revocation
Deletion & Recovery	Company deletion queue, Owner recovery cases and identity-verification evidence
Network Governance	Public company profiles, jobs, tenders, reports, suspensions and moderation
Integrations	Microsoft, Google, WhatsApp and provider-level health/configuration
Platform Health	Services, databases, queues, webhooks, storage, backups, latency and incidents
Audit	Privileged actions, archived logs, exports and investigations
Platform Admins	Admin accounts, roles, permissions, status and access history
Settings	Global policies, languages, plans, limits, templates, statuses and notification defaults

5. Global Dashboard Overview

The landing page must prioritize decisions and operational risk rather than expose tenant business content.

Widget	Required information
Companies	Active, trial, pending verification, suspended, read-only

Widget	Required information
	deletion standby, dedicated database and shared database counts
Applications	New professional, new contractor, changes requested, resubmitted and overdue review counts
Deletion queue	Standby, ready for review, returned to Owner and approved-for-manual-deletion counts
Owner recovery	Open identity-verification and completed recovery cases
Subscriptions	MRR estimate, active paid companies, failed payments, overdue invoices, seat/storage overages and plan distribution
Support access	Pending requests, active support sessions, sessions expiring soon and revoked sessions
Platform health	Service status, queue backlog, integration errors, webhook failures, backup warnings and active incidents
Security	Failed privileged logins, unusual admin actions, tenant-isolation alerts and unresolved critical events
Moderation	Reported public profiles, jobs, tenders, messages and duplicate-company alerts
Usage	Licensed users, active users, storage, AI consumption, files and API volume by plan without exposing tenant record content

6. Company and Tenant Administration

Every company must have a platform-level tenant record distinct from its internal company profile.

6.1 Company list

- Search by company name, tenant ID, owner, domain, registration number, VAT number, country, status, plan and database type.
- Filter by active, pending, suspended, standby deletion, read-only, dedicated database, shared database, payment issue and verification status.
- Display company name, tenant ID, Owner, plan, licensed users, modules, storage, database type, verification status, account status, created date and last activity.

6.2 Company tenant page

Tab	Platform-level content
Summary	Status, Owner, plan, modules, usage, verification, incidents and pending actions
Owner & Admins	Owner identity and Company Admin list; Platform Admin cannot modify Owner except approved recovery workflow
Subscription	Plan, seats, modules, storage, AI quota, billing status and entitlement history
Architecture	Shared multi-tenant or dedicated database, region, storage bucket and migration status

Tab	Platform-level content
Support	Support requests, approved scopes, active sessions and history
Verification	Documents, reviewer decisions, duplicate checks and company status
Deletion	Owner request, standby timeline, final review and deletion execution checklist
Audit	Platform-level actions affecting this tenant
Incidents	Tenant-specific outages, sync failures, integration issues and security events

6.3 Allowed Platform Admin actions

- Approve or return a company application where company approval is enabled.
- Verify or unverify a company profile according to policy.
- Suspend or reactivate a tenant for platform-policy, security or billing reasons.
- Change plan, modules, storage quota, user entitlement and database tier where authorized.
- Initiate or monitor migration from shared infrastructure to dedicated enterprise infrastructure.
- Review support requests and enter only an approved support session.
- Process Owner account recovery.
- Process final company deletion after the seven-day standby.

6.4 Prohibited default actions

- Browse company projects, tasks, Finance, HR, Legal, contracts or documents.
- Impersonate Company Owner.
- Change Company Owner identity, permissions or ownership status outside Owner recovery.
- Create, edit or delete company operational records without an active approved support session.
- Expose one company's tenant metadata to another company.

7. Company Application and Verification

Where company sign-up or company activation requires platform review, the dashboard must include a structured application process similar to professional and contractor approval.

Status	Meaning
Draft	Company application started but not submitted
Submitted	Awaiting Platform Admin review
Under Review	Assigned reviewer is checking the application
Changes Requested	Company must correct or add information
Resubmitted	Company returned the corrected application
Approved	Tenant may be activated
Rejected	Application rejected with reason
Suspended	Previously active tenant temporarily disabled

Review data may include legal company name, registration number, VAT/tax number, country, headquarters, Owner identity, website/domain, requested plan, expected users, business description, documents and duplicate indicators.

8. Company Owner Protection and Recovery

Confirmed hierarchy

The Company Owner is above all Company Admins. Company Admins cannot edit, deactivate, reset, remove, impersonate, transfer or otherwise modify the Company Owner account.

8.1 Recovery authority

- Only one authorized Platform Admin is required to recover the Company Owner account.
- Strict identity verification is mandatory before recovery.
- Recovery changes or restores credentials only.
- Recovery does not grant Platform Admin access to company business data.
- The complete recovery case is audited.

8.2 Recovery case

Field	Requirement
Case ID	Permanent unique recovery case ID
Company	Tenant and legal company identity
Owner	Owner account being recovered
Reason	Lost access, compromised credentials or other verified reason
Verification	Identity documents, company evidence and verification notes
Reviewer	Platform Admin who performed verification
Action	Reset credentials, restore account or unlock account
Data access	Must remain No
Outcome	Completed, failed or cancelled
Audit	All steps, files, timestamps and decisions retained

9. Company Deletion Governance

Company deletion is an Owner-controlled request with Platform Admin final execution authority.

9.1 Required workflow

1. Company Owner requests permanent deletion.
2. Company enters a seven-day standby period.
3. The entire company becomes read-only for all users during standby.
4. The Owner may cancel during standby.
5. After standby, the case enters Platform Admin final review.
6. Platform Admin may either approve deletion or return the request to the Owner for cancellation.
7. Platform Admin cannot independently reject or indefinitely pause the request.

8. Deletion is performed manually only after Platform Admin approval.
9. Production data, files, databases and backups are included in the manual deletion process.
10. Completion evidence and deletion audit are retained according to platform legal policy without retaining deleted tenant content.

9.2 Deletion dashboard

Queue	Contents
Standby	Company, Owner, request time, standby end time and cancellation status
Ready for review	Completed standby requests awaiting Platform Admin action
Returned to Owner	Requests sent back so the Owner can cancel
Approved for deletion	Approved cases awaiting manual execution
Deletion in progress	Checklist for databases, storage, files, integrations, tokens and backups
Completed	Deletion evidence, executor, completion time and verification result

10. Professional and Contractor Application Review

This section incorporates PRD_6 into the Platform Admin Dashboard.

Capability	Requirement
Queues	New, Pending Review, Changes Requested, Resubmitted, Approved, Rejected and Suspended
Filters	Profile type, profession/service, country, submission date, completion, risk flags, documents and reviewer
Review	Open full structured profile, CV/company profile, portfolio, certificates, licenses and verification documents
Actions	Approve, approve with restrictions, request changes, request documents, reject, suspend, reactivate or escalate
Duplicate control	Check email, phone, registration, VAT, domain and license numbers; never auto-merge
Activation	Approved professionals gain jobs/invitations/network; approved contractors gain tenders/invitations/network
Workspace boundary	Approval never grants private company workspace access; a company invitation is still required
Audit	Every status change, reviewer action, note and document request is immutable-audited

11. Subscription, Licensing and Module Control

Construction OS uses modular billing tied to active licensed users, storage, modules and premium options. Non-login employee records and external guest accounts do not consume standard internal licenses.

Control	Platform Admin capability
Plan	Assign or change company plan
Licensed users	Set included seats and overage rules
Modules	Activate/deactivate purchased modules
Storage	Set quota and paid overage
AI	Set included usage and overage policy
Database tier	Shared multi-tenant or dedicated enterprise database
Premium options	Digital Twin, BIM, white label, priority support, dedicated hosting and custom integrations
Grace periods	Configure failed-payment or overage handling
Entitlement history	Retain every change with actor, reason and effective date

The dashboard must show actual usage versus entitlement without allowing Platform Admin to browse tenant business content.

12. Billing and Usage Oversight

Area	Required information
Subscription	Current plan, billing cycle, status, renewal and currency
Users	Licensed, active, invited, inactive and non-login employee records
Storage	Used, quota, overage and file growth
AI	Usage, included quota and overage
Premium modules	Active module, quantity, project scope and price configuration
Invoices	Issued, paid, overdue, failed and credited
Payment exceptions	Failed charge, expired method, manual invoice or suspended billing
Revenue reporting	Aggregate platform revenue only; no tenant internal Finance data

13. Support-Access Governance

Confirmed rule

Company data belongs to the company. Platform support access is temporary, company-approved, scoped, time-limited, visible and fully logged.

13.1 Support request fields

- Company and tenant ID
- Requested by Company Owner or authorized company contact

- Problem description
- Requested scope
- Allowed modules or records
- Read-only or edit support mode
- Start time and expiration
- Assigned Platform Support Admin
- Company approval evidence
- Reason for extension, if requested

13.2 Support session controls

- Session banner visible to support operator and company.
- Session expires automatically.
- Company Owner can revoke the session immediately.
- Support operator cannot expand scope unilaterally.
- Every viewed or modified record is logged where technically feasible.
- Downloads and exports are disabled unless explicitly included in scope.
- Support actions must be recorded as Platform Admin acting in support mode, not as the company user.

14. Platform Security and Tenant Isolation

Requirement	Implementation expectation
Tenant isolation	Every platform query and job must be tenant-scoped; cross-tenant access tests are mandatory
Hybrid databases	Shared strict-isolation database for standard tenants; dedicated database option for Enterprise
Secrets	Store OAuth tokens, database credentials and signing keys in managed secret storage
Admin authentication	Strong authentication, session controls, rate limiting and privileged-action protection
Admin authorization	Backend-enforced Platform Admin permission checks
Sensitive display	Mask billing methods, identity documents and secrets by default
Exports	Permissioned, logged and time-limited
Incident controls	Emergency tenant suspension and token revocation without exposing tenant content
Support boundary	No access outside an active approved support session
Owner recovery boundary	Credential recovery only; no tenant data access

15. Audit, Archive and Evidence

Platform audit logs are immutable. Platform Admins may archive audit logs but cannot alter or permanently delete them.

Audit event category	Examples
Platform Admin access	Login, logout, failed login, role change and session revocation
Company administration	Approval, suspension, plan change, module change and database migration
Applications	Review, changes requested, approval, rejection, suspension and reactivation
Support	Request, approval, session start, data access, changes, export, revoke and expiration
Recovery	Owner identity verification, credential reset and completion
Deletion	Owner request, standby, cancellation, Platform Admin approval, execution steps and completion
Billing	Plan, invoice, entitlement and quota changes
Moderation	Report, decision, content removal, suspension and appeal
Security	Privilege use, isolation alerts, token revocation and incident actions

Archived logs must remain searchable, exportable and attributable. They may move to lower-cost storage but must preserve integrity and chain of custody.

16. Public Network and Content Moderation

The platform includes public company profiles, professional profiles, contractor profiles, jobs, tenders, business opportunities and messaging. Platform Admin requires governance tools that do not expose private tenant data.

Moderation object	Actions
Professional profile	Review, approve, request changes, suspend, reactivate and investigate reports
Contractor profile	Review legal identity, services, documents, duplicate company and reports
Company public profile	Verify, unverify, request correction, suspend public visibility
Job posting	Review reports, hide, restore or remove
Tender/opportunity	Review reports, hide, restore, remove or suspend publisher
Public project	Review visibility, rights complaints and misleading content
Message abuse	Review reported messages only under a specific abuse workflow and privacy policy
Portfolio rights	Process claims of stolen or unauthorized work

17. Tender, Jobs and Opportunity Governance

- Platform Admin may define global publishing rules and prohibited categories.
- Platform Admin may review reported public or invited opportunities only when platform policy requires it.
- Private final contracts created after award remain tenant-controlled and are not visible to Platform Admin by default.

- Platform Admin may suspend abusive publishers or remove fraudulent postings.
- Every moderation decision must be audited.

18. Trust, Verification and Duplicate Control

Company verification and platform trust indicators should rely primarily on objective platform data. The exact Trust Score formula remains a product decision and must not be hard-coded before approval.

Capability	Requirement
Verification badge	Controlled by Platform Admin based on documented verification policy
Duplicate detection	Flag likely duplicate companies/profiles using identifiers and domains
Manual resolution	Never auto-merge; allow link, ownership request, reject or keep separate
Objective indicators	Verified identity, active licenses, completed platform relationships, document validity and platform conduct
Restricted data	Do not expose internal disputes, private financials or confidential company records in public trust indicators
Appeal	Suspended or unverified profiles may submit evidence for review

19. Integration Administration

The Platform Admin Integration page manages provider-level configuration and health, not company mailbox or file content.

Provider/area	Platform-level controls
Microsoft 365	Application registration status, webhook health, token errors, subscription renewal failures and provider limits
Google Workspace	OAuth status, Drive notifications, Gmail Pub/Sub health and provider errors
WhatsApp	Provider account, template status, delivery failures and usage
Email	Delivery provider status, bounces, complaint rate and templates
Storage	Object storage health, malware scanning and upload errors
Future providers	Connector registry, version, enabled plans and service health

Company-specific connections remain controlled by company authorization. Platform Admin may troubleshoot connection metadata but cannot open company email or cloud files without approved support access.

20. Notifications and Escalation

Event	Default recipient
New company application	Company Operations Admin queue

Event	Default recipient
New professional/contractor application	Application Reviewer queue
Application SLA exceeded	Assigned reviewer and reviewer manager
Owner recovery case	Authorized Platform Admin
Company deletion standby completed	Company Operations Admin
Support request pending	Support Admin
Support session expiring	Support Admin and requesting company contact
Failed payment	Billing Admin and company billing contact
Tenant storage/license overage	Billing Admin and Company Owner
Critical platform incident	Technical Operations, Security and Platform Super Admin
Tenant-isolation alert	Security and Platform Super Admin
Reported public content	Trust & Safety queue

21. Platform Health and Operational Monitoring

Monitoring area	Required indicators
Application services	Availability, latency, error rate and deployment version
Databases	Connection health, replication, storage, slow queries and tenant migration status
Queues and jobs	Backlog, failed jobs, retry count and oldest item age
File processing	Upload failures, malware scan failures, preview-generation backlog
Notifications	Email, WhatsApp, in-app and webhook delivery success
Integrations	OAuth errors, expired tokens, webhook failures and provider throttling
Backups	Last successful backup, restore test, retention and failures
Offline sync	Sync failure rates, conflict rates and queue age
AI	Provider availability, cost, usage and rate limits
Digital Twin/BIM	Processing jobs, storage, GPU/streaming health where enabled

Operational dashboards must avoid displaying tenant document content, email bodies, task comments or other business data unless an approved incident/support process explicitly authorizes access.

22. Search and Cross-Platform Navigation

- Global Platform Admin search must cover companies, tenant IDs, Owners, applications, profiles, subscriptions, support cases, deletion cases, recovery cases, incidents and audit events.
- Search results must not return tenant business records.
- Restricted Platform Admin pages must remain hidden or locked according to platform role.

- Opening a result must preserve Platform Admin dashboard context and must never redirect into a company role dashboard.
- Every entity requires a permanent unique ID and 360-degree Platform Admin record page.

23. Platform Admin Record Pages

Record	Required 360-degree view
Company tenant	Summary, Owner, Admins, plan, usage, architecture, verification, support, deletion, incidents and audit
Professional application	Profile, CV, portfolio, documents, duplicate signals, review, messages and timeline
Contractor application	Company identity, services, projects, compliance documents, duplicate signals, review and timeline
Support case	Company request, scope, approval, session, actions, expiry and audit
Deletion case	Owner request, standby, final review, checklist, execution and completion
Owner recovery case	Identity verification, reviewer, credential action and outcome
Incident	Services, affected tenants, severity, timeline, actions, communication and resolution
Platform Admin	Role, permissions, sessions, actions, status and security history

24. Required Data Model

- PlatformAdmin
- PlatformRole
- PlatformPermission
- PlatformAdminRoleAssignment
- PlatformAdminSession
- CompanyTenant
- CompanyApplication
- CompanyVerification
- TenantEntitlement
- TenantUsageSnapshot
- Subscription
- SubscriptionModule
- BillingAccount
- BillingInvoice
- SupportAccessRequest
- SupportSession
- SupportScope
- SupportActionLog
- OwnerRecoveryCase
- OwnerVerificationEvidence
- CompanyDeletionRequest
- CompanyDeletionStep

- DeletionExecutionLog
- PublicProfileApplication
- ApplicationReview
- ApplicationChangeRequest
- ProfileVerification
- DuplicateMatch
- ModerationCase
- ModerationAction
- TrustIndicator
- IntegrationProvider
- ProviderHealthEvent
- PlatformIncident
- PlatformNotification
- PlatformAuditEvent
- ArchivedAuditPackage

Every platform entity must include tenant or platform scope, created/updated timestamps, actor IDs, status history and audit references where applicable.

25. Suggested APIs and Services

Method	Endpoint	Purpose
GET	/api/platform/overview	Platform KPIs and queues
GET	/api/platform/companies	Search and filter tenants
GET	/api/platform/companies/:tenantId	Tenant admin record
PATCH	/api/platform/companies/:tenantId/status	Suspend/reactivate tenant
PATCH	/api/platform/companies/:tenantId/entitlements	Plan/module/quota changes
GET	/api/platform/applications	Professional and contractor queues
POST	/api/platform/applications/:id/approve	Approve application
POST	/api/platform/applications/:id/request-changes	Request corrections
POST	/api/platform/applications/:id/reject	Reject application
POST	/api/platform/support/:id/start	Start approved support session
POST	/api/platform/support/:id/revoke	Revoke support session
POST	/api/platform/owner-recovery/:id/complete	Complete verified Owner recovery
POST	/api/platform/company-deletions/:id/approve	Approve manual deletion
POST	/api/platform/company-deletions/:id/return	Return request to Owner for cancellation
POST	/api/platform/company-deletions/:id/execute-step	Record manual deletion step
GET	/api/platform/audit	Search platform audit

Method	Endpoint	Purpose
POST	/api/platform/audit/archive	Archive immutable audit range
GET	/api/platform/health	Platform health summary
GET	/api/platform/integrations/health	Provider health
POST	/api/platform/moderation/:id/action	Execute moderation decision

All privileged APIs must enforce backend authorization, create audit events, validate state transitions and use idempotency controls for destructive or billing-sensitive actions.

26. Permission Matrix

Action	Super Admin	Operations	Reviewer	Billing	Support	Trust & Safety	Technical Ops
View platform overview	Yes	Yes	Limited	Limited	Limited	Limited	Yes
Manage Platform Admins	Yes	No	No	No	No	No	No
Approve company application	Yes	Yes	No	No	No	No	No
Review professional/contractor	Yes	Limited	Yes	No	No	Yes	No
Change subscription entitlement	Yes	Limited	No	Yes	No	No	No
Start support session	Yes	No	No	No	Yes	No	No
Recover Company Owner	Yes	Authorized only	No	No	No	No	No
Approve company deletion	Yes	Authorized only	No	No	No	No	No
Moderate public content	Yes	No	Limited	No	No	Yes	No
View platform health	Yes	Limited	No	No	Limited	No	Yes
Archive audit logs	Yes	No	No	No	No	No	Authorized only
Access tenant business data	No by default	No	No	No	Approved session only	No	No

27. Security Controls

- Privileged Platform Admin accounts must be distinct from normal public or company accounts.
- Platform Admin login must support strong authentication and secure recovery.
- High-risk actions require re-authentication or equivalent privileged-action confirmation.
- Owner recovery, company deletion, support session start, plan downgrade and tenant suspension must be idempotent and audited.
- No Platform Admin endpoint may trust frontend role claims.
- Tenant identifiers must be validated at every service boundary.
- Logs must avoid leaking secrets, access tokens, document contents or personal identity documents.
- Exports must use expiring download links and record the exporter.
- Admin sessions must support revocation and inactivity timeout.
- Platform incident access must remain narrower than routine support access.

28. Non-Functional Requirements

Area	Requirement
Performance	Common Platform Admin list pages load within two seconds under expected production load, excluding provider delays
Scalability	Support thousands of companies and millions of public/tenant records without cross-tenant leakage
Availability	Platform Admin controls remain available during partial tenant-service incidents where technically possible
Auditability	Every privileged state change produces a durable audit event
Localization	English and Albanian interface support; European number formatting
Responsiveness	Desktop-first with tablet support; emergency actions usable on mobile
Accessibility	Keyboard navigation, labels, contrast, focus states and screen-reader-compatible tables
Reliability	Destructive workflows use confirmation, idempotency and resumable execution
Observability	Structured logs, metrics, traces, job status and incident correlation IDs
Privacy	Only required application, billing, platform and support metadata is visible to Platform Admin

29. Acceptance Criteria

1. Platform Admin has a dedicated dashboard shell separate from all company role dashboards.
2. The overview shows companies, applications, deletion, recovery, subscriptions, support, health, security and moderation queues.

3. Platform Admin can search and open a complete company tenant administration page without seeing company business records.
4. Professional and contractor applications can be approved, restricted, returned, rejected, suspended and reactivated.
5. Approved public profiles do not automatically gain private company workspace access.
6. Company Owner cannot be edited, reset, deactivated, removed or impersonated by Company Admin.
7. One authorized Platform Admin can recover a Company Owner account after strict identity verification.
8. Owner recovery does not provide access to company projects, Finance, HR, Legal, documents or contracts.
9. Company deletion creates a seven-day read-only standby period.
10. Deletion is not automatic after standby and requires manual Platform Admin approval.
11. Platform Admin can only approve deletion or return it to the Owner for cancellation.
12. Manual deletion tracks databases, files, storage, integrations and backups through a checklist and audit trail.
13. Support access cannot begin without company approval, defined scope and expiration.
14. Support access automatically expires and may be revoked by the Company Owner.
15. Every support action is attributable to the Platform Admin acting in support mode.
16. Platform audit logs cannot be altered or permanently deleted; they may be archived.
17. Subscription plans, licensed users, modules, storage and premium options can be administered without reading tenant content.
18. Shared and dedicated database tenants are distinguishable and migration status is visible.
19. Global search never returns tenant operational records.
20. Backend tests prove tenant isolation for all Platform Admin endpoints.
21. Platform health displays services, databases, queues, files, notifications, integrations and backups.
22. All privileged actions create immutable audit events.
23. Permission tests cover every Platform Admin role and restricted action.
24. The complete interface works in English and Albanian.

30. Open Decisions and Future Phases

The following items were not fully finalized and should remain configurable or deferred rather than assumed:

- Exact Trust Score formula and public display rules.
- Exact company application approval policy and whether every company requires review before tenant activation.
- Payment gateway and automated billing provider.
- Production backup retention and legal evidence retained after approved deletion.
- Exact Platform Admin authentication method and whether hardware security keys are mandatory.
- Dual approval for selected destructive or security-sensitive platform actions.
- Country-specific company verification rules.
- Formal appeal workflow for rejected or suspended companies and profiles.
- Support-access recording granularity and whether screen recording is required for certain plans.
- Public content moderation SLAs and escalation policy.
- Exact incident-severity matrix and customer communication templates.

Final Product Rule

Platform governance boundary

Platform Admin must have enough authority to operate, secure, support, bill and govern Construction OS, while remaining technically prevented from becoming an invisible super-user inside customer companies. Company Owner controls the company. Platform Admin controls the platform. Any exception must be explicit, scoped, temporary and audited.
