

CONSTRUCTION OS

PRD_12

Client, Contract, Payment and
Purchased-Unit Management

Company dashboard client records linked to contracts, projects, units, plans, payments and cross-department actions

Version	1.0
Date	3 August 2026
Status	Confirmed Scope - Full-Stack Implementation Specification
Audience	Senior Full-Stack Engineering, Product, QA, DevOps, Security and Data Teams

Compatibility rule

This PRD extends the Construction OS master product requirements and all earlier PRDs. Earlier requirements remain authoritative unless this document explicitly amends them.

- 13 Security and Audit
- 14 Acceptance Criteria
- 15 Deferred Decisions

1. Executive Purpose

PRD_12 defines the Client panel inside each company dashboard. The panel must give authorized company departments a single, structured view of every client, the contract through which the client purchased a unit, the related project, contract documents, financial status and a unique purchased-unit page connected to the Architect Unit page.

Supported purchased-unit categories

Apartment, villa, office, commercial unit and other future property-unit categories must use the same client-contract-unit relationship model.

2. Client Entity and Types

A client may be an individual, a company or another legal entity. The platform must support configurable fields by client type while maintaining one common client identity model.

Client type	Example configurable fields
Individual	Full name, personal ID/passport, date of birth where required, address, email, phone, nationality and preferred contact method.
Company	Legal name, registration number, tax number, registered address, representatives, email, phone and billing contacts.
Other legal entity	Entity type, legal identity fields, registration/tax information, authorized representatives and configurable supporting documents.

CL-ENT-001 Tenant-scoped client identity

A client record belongs to one company tenant. A similar person or legal entity in another tenant must not become visible or linked automatically.

3. Client Page Information Architecture

Section	Required information
Client identity	Client name/legal name, client type, identification fields and status.
Contact information	Phone, email, address, representatives and preferred contact method.
Contracts	Every contract through which the client bought a unit; contract number/status; clickable link to the full contract.
Projects	Project containing each purchased unit; clickable project reference.
Purchased units	Unit code, type, project, building/block/floor where applicable, status and link to unique purchased-unit page.
Contract documents	Copy of signed contract and permitted revisions/attachments.
Financial summary	Approved contract value, payment history, total paid and amount still due, subject to Finance permissions.
Activity/comments	Sales, Finance and permitted cross-department comments, tags and linked tasks.
Consolidated totals	Combined value, paid amount and outstanding amount across all contracts, as extended by PRD_13.

4. Section-Level Access Control

Client access is divided by section. Opening the Client Page does not automatically grant access to all client data.

Role/department	Permitted client sections
Sales	Client identity, contact information, purchased units, contract status and sales comments.
Finance	Contract values, schedules/invoices, payment records, total paid, outstanding balance and Finance comments.
Legal	Contracts, contract copies, revisions and legal documents.
Architects	Purchased-unit page, connected Architect Unit page, floor plans and approved modification/request comments.
Relevant Project Manager	Project and unit progress needed for the relevant project.
Company Admin / Company Owner	Complete client record.
Other users	Only sections granted through existing role and record permissions.

CL-ACL-001 Server-side section enforcement

Every sensitive client field, attachment and API route must enforce section-level permissions on the backend. Hidden frontend tabs are not sufficient authorization.

5. Contracts, Projects and Purchased Units

- Every purchased unit must link to at least one client contract and one project.
- A client may have multiple contracts and multiple purchased units.
- A contract may include one or more purchased units.
- The contract record and contract copy must be clickable from the Client Page for users with Legal/contract access.
- The project reference must be clickable for users who can open the project.
- The purchased-unit page must be clickable for users with unit access.
- Click behavior must respect existing permissions; a link may be shown with restricted state or omitted according to the established access model.

CL-LINK-001 No duplicated authoritative contract copy

The Client Page must reference the official contract document stored in the contract/document-control system rather than maintain an independent uncontrolled duplicate.

6. Multiple Buyers

Confirmed structure

When multiple buyers share the same contract or unit, every buyer receives a separate Client Page. All buyer records link to the same contract and the same purchased-unit record. Ownership percentages are not stored.

CL-BUY-001 Co-buyer navigation

The contract and purchased-unit pages must list linked client records so authorized users can navigate between co-buyers without merging their identities or contact information.

CL-BUY-002 No ownership-share calculation

The platform must not infer equal shares or display ownership percentages unless a future PRD adds this capability.

7. Purchased-Unit and Architect Unit Connection

Every unit bought from the company must have a unique purchased-unit page connected to the canonical Architect Unit page.

Purchased-unit page element	Source/behavior
Unit identity	Unit code, unit type, project, building/block, floor and current commercial status.
Client and contract links	Linked client(s), contract(s) and contract status.
Floor plans	Reference the approved floor plans on the Architect Unit page.
Plan revisions	Show permitted revision metadata and the currently approved plan; do not duplicate the authoritative plan file.
Sales/Finance requests	Comments and tagged requests linked to the unit and contract.
Architect actions	Tasks created from tagged contract comments and their current status.
Project progress	Relevant unit/project progress visible to permitted users.

CL-UNIT-001 Canonical unit source

Architectural geometry, plans and technical unit data remain authoritative on the Architect Unit page. The purchased-unit page consumes those records through references.

8. Contract Comments and Architect Tasks

Finance or Sales may write a comment inside the client contract and tag an Architect. A tagged Architect comment is not merely informational: it automatically creates an actionable Architect task.

1. Finance or Sales opens the client contract comment section.
2. The user writes the request and tags an Architect.
3. The platform creates an Architect task linked to the client, contract, purchased unit and original comment.
4. The comment displays the linked task ID, assignee, due/status information and completion state.
5. The Architect completes/submit the task.
6. The Finance department reviews and formally closes the task.
7. The original comment and task remain cross-linked and show the review/closure status.

CL-TASK-001 Automatic task creation

Task creation must occur in the same transaction or through a reliable event/outbox process so the contract comment cannot exist in a tagged actionable state without its task.

CL-TASK-002 Finance closure authority

Architect completion does not close the workflow. A Finance user with the required permission must perform the final review and closure.

Deferred exception path

The behavior when Finance rejects the Architect submission - reopen same task, create correction task or escalate - is deferred.

9. Client Payment Structure

PRD_12 establishes the client receivable structure. PRD_13 extends it with detailed manual Finance-approved summaries, payment records, reconciliation warnings and consolidated totals.

- Scheduled installments and invoices define what is due under the contract.
- Finance records or imports actual payments and matches them to the relevant client contract, installment and invoice.
- When one payment may cover multiple installments, invoices, contracts or purchased units, Finance manually selects the allocation.
- The system must not automatically allocate payments based on age, due date or payment references.
- Financial values and payment details are visible only according to section-level permissions.
- Automatic reminder and escalation behavior for installments is not defined in this PRD.

10. Frontend Requirements

Screen/component	Minimum behavior
Client directory	Search/filter by name, client type, contact, project, contract, unit and status.
Client header	Identity, contact summary, client type, status and permitted quick actions.
Contracts tab	Clickable contracts, project/unit links, contract copy, status and permitted financial summary.
Purchased Units tab	One card/row per unit with project, type, status and link to purchased-unit page.
Payments tab	Schedules/invoices, detailed payment records, manual allocations and totals for Finance-authorized users.
Comments/activity	Threaded comments, user tagging, linked task state and audit-friendly timestamps.
Co-buyers	Separate client records shown as linked buyers on shared contract/unit.
Restricted sections	Do not render values or documents the user cannot access; direct URLs must return authorization errors.

11. Backend and Data Model

Entity	Essential fields/relationships
Client	Tenant, type, display/legal name, status, configurable identity/contact fields.
ClientContact	Client, contact type, value, purpose, primary flag and permission classification.
ClientContractLink	Client, contract, role/link status and created/audit fields.
ContractUnitLink	Contract, purchased unit and project relationship.
PurchasedUnit	Canonical unit reference, project, commercial status and Architect Unit link.
ClientUnitLink	Client, purchased unit and contract; one record per client-unit-contract relationship.
PaymentScheduleItem	Contract, invoice/installment reference, amount, due date and status.

Entity	Essential fields/relationships
ClientPayment	Client/contract, date, amount, reference, method, proof document and Finance status.
PaymentAllocation	Payment, target contract/invoice/installment/unit and allocated amount.
ContractComment	Contract, author, text, tags, attachments and linked task.
ArchitectTaskLink	Task, source comment, client, contract, unit and Finance closure status.

CL-DATA-001 Configurable client fields

Configurable fields must be versioned per client type and tenant so schema changes do not destroy historical values.

CL-DATA-002 Reference integrity

Deleting or archiving a client must not orphan contracts, payment records, purchased units, comments or audit history.

12. API and Event Requirements

Capability	Requirement
Client read API	Return only fields and sections authorized for the requesting user.
Client search API	Search permitted metadata without leaking restricted financial or legal values.
Contract/unit linking	Validate same tenant and valid project/unit relationships.
Payment allocation API	Require Finance authorization and validate allocations against payment amount.
Comment/tag event	Emit an idempotent event that creates one linked Architect task.
Finance closure API	Require Finance permission and retain Architect completion history.
Document access	Use secure document authorization and signed/controlled download mechanisms.

13. Security and Audit

- Treat client identity, contact, contracts and payment information as sensitive tenant data.
- Audit client creation, identity changes, contract/unit links, financial changes, payment allocation, document access and task closure.
- Do not expose client contact or financial data through global search results to unauthorized users.
- Preserve original comment text and task linkage after workflow completion.
- Use existing immutable audit rules for changes to official contract documents.
- Require explicit permissions for export, bulk download and client-data reporting.

14. Acceptance Criteria

ID	Acceptance criterion
AC-12-01	A client can be created as an individual, company or other legal entity with appropriate configurable fields.
AC-12-02	Sales can see contact/unit/status information but cannot retrieve Finance-only values through the UI or API.
AC-12-03	Two co-buyers have separate Client Pages linked to the same contract and purchased unit, without ownership percentages.
AC-12-04	Every contract, project and purchased unit is clickable subject to the user permission.
AC-12-05	The purchased-unit page displays referenced approved floor plans from the Architect Unit page.
AC-12-06	Tagging an Architect in a Finance/Sales contract comment creates exactly one linked Architect task.
AC-12-07	The Architect can complete the task, but only Finance can formally close it.

ID	Acceptance criterion
AC-12-08	Finance can manually allocate one client payment across selected invoices/installments/contracts/units.
AC-12-09	Company Admin and Company Owner can open the complete Client Page.
AC-12-10	Unauthorized direct API or document requests are denied even when a user knows the record ID.

15. Deferred Decisions

- Finance rejection and correction workflow for an Architect result.
- Automatic reminders and escalation rules for client installments and overdue amounts.
- Client-facing portal access, if any.
- Client merge/deduplication rules and identity conflict resolution.
- Formal ownership-share tracking for co-buyers.
- Notification rules for every comment, payment, contract or unit change.
