

CONSTRUCTION OS

PRD - Architect Dashboard

Project-Centric Architecture Role Workspace

Implementation-ready Product Requirements Document for Product, UX/UI, Frontend, Backend, Security, QA and DevOps Teams.

Product purpose: Define the exact Architecture user role shell, dashboard, project workspace, design coordination surfaces and cross-module behavior. The experience is intentionally simple: open Dashboard, see assigned projects, see what needs attention, enter a project and do the work.

Field	Value
Document	PRD_Architect_Dashboard
Version	1.0
Status	Implementation-ready role dashboard specification
Primary role	Architect / Design Manager
Base requirements	Construction OS Master PRD + PRD_2 Role Centers
Connected domains	Projects, Documents/Drawings, Tasks, Approvals, Calendar/Meetings, BIM/3D, CRM/Client Requests
Platform alignment	Role Context, Role & Permission Matrix, Platform UI/UX, Approvals & Workflow
Scope	Architecture dashboard + exact sidebar + assigned-project workspace
Date	2026-08-07

Permanent dashboard scope lock

The Architect Dashboard and Architecture role sidebar shall contain only the elements explicitly defined in this PRD. Developers must not add, infer, duplicate, substitute or auto-expose extra dashboard widgets, modules or shortcuts without an approved PRD revision. Platform Configuration may hide approved elements; it may not create unapproved ones.

Document Authority and Source Alignment

Priority	Authority	Controls
1	Complete Role & Permission Matrix	Authorization, scope, deny-by-default behavior, field restrictions, revocation and audit.
2	Construction OS Master PRD - Architecture and Engineering Workspaces	Architect responsibilities, assigned-project default, drawings, RFIs, revisions, submittals, approvals, tasks and client requests.
3	PRD_2 - Role Centers and Cues	Fixed role dashboard regions, Architect primary cues, Work Inbox, recent activity and operational content.
4	Documents / Drawings requirements	Controlled drawings, revisions, RFIs, submittals, Draft Mode, approvals, current/superseded state and official files.
5	Tasks / Calendar / Approvals / BIM PRDs	Execution, time/meeting projection, approval orchestration and model navigation.
6	Role Context Navigation PRD	Architecture shell remains active when shared modules are opened.
7	Platform UI/UX Architecture	Shared shell, progressive disclosure, responsive behavior, accessibility, motion and component patterns.
8	This PRD	Exact Architect dashboard composition, sidebar and project-centric UX decisions.

1. Executive Purpose

- Give Architects one calm workspace centered on assigned projects and immediate design work.
- Reduce navigation depth: common Architect work must be reachable within two navigation decisions.
- Show priority work before analytics: drawings, RFIs, revisions, approvals, tasks and client requests that require action.
- Keep project context visible while moving between Drawings, RFIs, Documents, Tasks, Approvals, Calendar and BIM.
- Reuse authoritative source modules rather than creating a separate Architecture copy of project, file, task, client or approval records.

Final product position

Architect opens Dashboard -> sees assigned projects -> sees what needs attention -> enters a project -> completes design work. Complexity stays behind progressive disclosure.

2. Goals and Non-Goals

In scope	Out of scope
Exact Architecture sidebar and header	A separate Architect application with copied modules
Fixed Architect dashboard composition	Arbitrary dashboard drag-and-drop in v1
Assigned-project portfolio and project workspace	Company-wide project discovery without permission
Drawings, RFIs, revisions, submittals and approvals navigation	Redefining Documents/Workflow source records
Client floor-plan/customisation design requests	Sales pipeline or Finance data not required for design work
Documents/Tranzit and BIM navigation	Replacing controlled Documents with BIM storage
Tasks, deadlines, meetings and recent activity projections	A second task/calendar engine inside Architecture

3. Core UX Principles

Principle	Required behavior
Project first	Assigned projects are the primary operating scope and the largest dashboard element.
Attention first	Actionable work appears before passive activity or reporting.
Four primary cues	Use the four confirmed Architect cues; secondary counts remain inside work sections.
Progressive disclosure	Dashboard is simple; detailed registers and record pages hold enterprise depth.
Context continuity	Project selection persists through Architecture pages until changed or no longer authorized.
One source of truth	Dashboard/workspace displays projections and links; source modules own records.
No irrelevant Finance	Architecture views never reveal unrelated Finance data because a linked project/client exists.

4. Architecture Application Shell

```

Authenticated Application
├─ Active company context
├─ Active Architecture role/workspace context
├─ Architecture header + sidebar
├─ Dashboard / Architecture pages
└─ Permission-filtered shared source-module content

```

- Role/workspace determines the shell. Route determines page content. Permissions determine visible data and actions.
- Opening Projects, Tasks, Documents, Clients, Meetings, Approvals or BIM must never switch the user away from the Architecture shell.
- Browser refresh, direct links, notifications, global search and browser history preserve active Architecture context.
- A multi-role user remains in Architecture until explicitly switching active role.

4.1 Persistent top header

Control	Required behavior
Company	Active company identity; switching company revalidates role, project scope and sidebar.
Project Scope	All Assigned Projects or one authorized Project.
Global Search	Permission-safe search across authorized records.
+ New	Context-aware quick create; only authorized Architecture-relevant record types.
Notifications	Permission-safe notifications with deep links into the Architecture shell.
Profile / Role	Authenticated user and active role/workspace context.

4.2 Exact left sidebar

ARCHITECTURE
Dashboard
Projects
DESIGN
Drawings
Revisions
RFIs
Submittals
COORDINATION
Approvals
Client Requests
WORK
Documents
BIM / 3D
Tasks
Calendar

- This is the exact v1 Architecture sidebar hierarchy.
- Sidebar group labels are visual separators, not separate routes.
- Unauthorized/configuration-disabled items disappear with clean reflow and no dead links.
- The sidebar remains visible and keeps its collapsed/expanded state when shared modules open.

5. Dashboard Information Architecture - Exact Layout

Architecture Dashboard
Header: All Assigned Projects Project selector Search + New
Primary Cues: Active Projects Pending Drawings Open RFIs Revisions Awaiting Approval
My Projects
Needs My Attention
Design Status
Upcoming
Recent Activity

Layout lock

These seven dashboard regions are the complete v1 dashboard. There is no Finance panel, sales pipeline, generic company KPI area, arbitrary chart area or user-added widget region.

6. Primary Cue Cards - Exact Set

Cue	Definition	Click-through
Active Projects	Count of active assigned projects visible to the Architect.	Projects filtered to active assigned scope.
Pending Drawings	Authorized drawing/design records requiring Architect action before submission/release.	Drawings filtered to actionable pending state.
Open RFIs	Authorized open RFIs in assigned project scope relevant to the Architect.	RFI register with the same scope/filter.
Revisions Awaiting Approval	Submitted drawing/design revisions currently in approval/review and visible to the Architect.	Revisions filtered to awaiting review/approval state.

- Each cue shows current count, status meaning and click-through destination.
- Counts must reconcile exactly with the resulting filtered register.

- Do not add more top-level KPI cards in v1. Approvals, tasks and client requests belong in Needs My Attention.

7. My Projects - Primary Dashboard Region

Project card element	Required content
Identity	Project name and optional project image/thumbnail from Projects when available.
Status	Canonical Project status and current design stage when available.
Attention chips	Open RFIs, pending drawings/revisions, approvals or overdue design tasks - permission filtered.
Next deadline	Nearest authorized Architecture-related deadline from Tasks/Calendar/Workflow.
Recent change	Latest meaningful Architecture activity for that project.
Action	Open Project Architecture Workspace.

No invented progress percentage

Do not display a generic "design progress %" unless a governed project/design metric exists in the source domain. Use canonical stage, status and actionable counts instead.

7.1 Project card behavior

- Default dashboard shows active assigned projects first.
- Cards remain compact; full project information belongs in the project workspace.
- Project card data must not expose unrelated commercial, HR or Finance fields.
- If the Architect has no assigned projects, show an empty state rather than company-wide projects.

8. Needs My Attention - Work Inbox

Type	Examples	Primary action
Drawing	Draft/returned drawing requiring update	Open drawing or draft.
RFI	RFI assigned to Architect or response due	Open RFI and respond where permitted.
Revision	Revision returned or requiring correction	Open revision comparison / update.
Approval	Review/approval work item assigned to Architect	Open approval workspace.
Task	Design task due today/overdue	Open Task.
Client Request	Floor-plan/customisation design request requiring action	Open request in project/client context.
Clarification	Returned submission/comment requiring response	Open source record and respond.

- Order by governed priority, due date and risk; critical/overdue work cannot be buried by recent low-value activity.
- Each item shows source module, project, record, current stage and due state.
- Dashboard inbox is a projection only; it never becomes a competing task or approval source of truth.
- Default visible views: My Priority, Due Today, Overdue and Waiting.

9. Design Status

Status group	Dashboard summary
Drawings	Current actionable drawing counts by Draft / In Review / Current-Approved / Returned where source state supports it.
RFIs	Open / Awaiting response / Overdue / Recently answered.
Revisions	Draft / Submitted / Returned / Approved-current / Superseded where applicable.
Submittals	Open / In Review / Approved / Rejected or returned based on source state.
Approvals	My pending design-related decisions plus waiting-on-others status.

Status source rule

The dashboard must render source statuses. It must not invent a separate Architecture-only lifecycle that can disagree with Documents, RFI/Submittal or Workflow state.

10. Upcoming

Item	Source / behavior
Design deadlines	Tasks / source record due dates.
Review deadlines	Workflow work-item SLA/due information.
Meetings	Calendar/Meetings records relevant to assigned projects.
Scheduled submissions	Authorized project/document deadlines when represented by source records.

- Upcoming is a compact context panel, not a second Calendar.
- Clicking an item opens the authoritative Task, Meeting, Approval or source record.
- Calendar owns agenda/time projections; Meetings owns meeting records and minutes.

11. Recent Activity

- Drawing uploaded or submitted.
- Revision created, returned, approved or superseded.
- RFI assigned, answered or overdue.
- Submittal submitted, approved or rejected.
- Design approval decision or information request.
- Client floor-plan/customisation request received or updated.
- Architecture-related task changed.
- Document promoted from Transit or official revision changed.

Activity is permission filtered

Activity items are projections of authoritative events. Revoked or unauthorized records must disappear from the user-facing activity feed without deleting source audit history.

12. + New - Exact Quick Create Behavior

Quick create item	Rule
Drawing / Design Package	Only when the user may create the source record in the current project.
RFI	Create in selected/required project context.
Submittal	Only where Architect is authorized to initiate the configured submittal type.
Task	Opens Tasks create flow with Architecture/project context prefilled.
Upload Document	Opens Documents upload flow in authorized project/folder context.

- Revision is not a generic quick-create item; a revision starts from the existing controlled drawing/document record.
- + New never bypasses required fields, approvals, Draft Mode or source-module validation.
- When no project is selected, project-required create flows must ask for an authorized project.

13. Projects Page - All Assigned Projects

Region	Required behavior
Scope	Only projects authorized for the current Architect; assigned projects by default.
Default view	Visual cards optimized for fast project recognition.
Alternate view	List view may be available using the shared register pattern.
Filters	Status, design stage, project, attention state and authorized company/branch context.
Card content	Project identity, status/stage, open design work, next deadline and latest Architecture activity.
Open action	Enter the Project Architecture Workspace without leaving Architecture shell.

14. Single Project Architecture Workspace

Architecture > Projects > [Project]

Overview | Drawings | RFIs | Revisions | Submittals | Approvals
Tasks | Client Requests | Documents | BIM / 3D | Activity

Workspace header	Content
Project identity	Canonical project name, status and authorized project metadata.
Design context	Current design stage / discipline context when available.
Attention	Open Architecture work and overdue/returned items.
Next deadline	Nearest relevant deadline.
Quick actions	Context-aware actions from the approved + New set.

Project workspace rule

This page is an Architecture lens over one Project. It must not create duplicate project, document, task, client, approval or BIM records.

14.1 Project Overview tab

- Project design summary and attention state.
- Key drawing packages and current revision state.
- Open RFIs and submittals.
- Pending approvals and design tasks.
- Upcoming deadlines/meetings.
- Recent project Architecture activity.

15. Drawings

Field / behavior	Requirement
Drawing identity	Number/code, title, project, discipline/type and controlled source reference.
Location context	Building / floor / zone / unit when source project structure provides it.
Current revision	Current controlled revision and status.
Author / reviewers	Authorized source metadata.
Approval status	Embedded source/workflow state; no duplicate approval engine.
Issue / current state	Clearly distinguish current official version from Draft or superseded version.
Files	Open controlled PDF/DWG/RVT/IFC or configured required formats through Documents permissions.

15.1 Drawing types supported by Architecture workspace

- Floor plans
- Elevations
- Sections
- Details
- Material schedules
- Renders
- Other configured architectural design packages

15.2 Draft and official-file behavior

- Drafts are visible only to author and selected collaborators until submitted according to source rules.
- A submitted material revision triggers the configured review/approval process.
- Superseded drawings remain retrievable but must never be presented as current.
- Official controlled files remain owned by Documents / drawing source records.

16. RFIs

RFI element	Requirement
Context	Project plus linked drawing/location/record where applicable.
Question	Source RFI question.
Assignee	Authorized responsible user/role.
Due date	Source due date and overdue state.
Response	Authoritative response and response metadata.
Status	Source RFI status.
Links	Related drawing, task, document, approval or BIM object when authorized.

- Dashboard Open RFIs cue and Project RFIs tab must reconcile to the same source query definition.
- Architect may answer only RFIs for which the user has the required capability and scope.
- Overdue state is derived from due date/status; it is not a manually editable dashboard flag.

17. Revisions

Revision element	Requirement
Parent drawing/document	Stable link to the controlled source record.
Revision code / description	Source values.
Author	Source metadata.
Reviewers / approvers	Resolved workflow/source participants.
Status	Draft / submitted / returned / approved / superseded as represented by source state.
Comparison	Open revision comparison where Documents supports it.
History	Previous versions remain preserved and permission controlled.

Approval invalidation

A material controlled-document change can invalidate prior approval stages according to Workflow policy. The Architect dashboard must show the current source/workflow result, not preserve a stale approved badge.

18. Submittals

- Show authorized material, technical-data, certification and design submittals relevant to Architecture.
- Expose project, package/type, submitter, due/review state, approval status and linked controlled documents.
- Opening a submittal uses the shared source record and approval workspace; Architecture does not duplicate the record.

19. Approvals

Architecture approval surface	Requirement
My pending	Design-related review/approval work items assigned to the current user.
Waiting on others	Submitted Architecture records whose workflow is active but no action is currently assigned to this user.
Returned / information requested	Items requiring correction or clarification.
Recently decided	Recent permitted design decisions for context.

- Workflow Engine owns routing, participants, decisions, delegation, SLA and escalation.
- The source module owns the record and final business status transition.
- Parallel and sequential cross-discipline review is supported.
- The dashboard never treats workflow approval as final source completion until the source confirms finalization.

20. Client Requests

20.1 Floor Plan Requests

Field	Architect view
Project / Unit	Authorized project and unit context.
Client	Only the client identity/details required and permitted for the design request.
Request	Required floor-plan/design deliverable.
Deliverables	Configured PDF/DWG/furniture/area package or other required design files.
Assigned Architect	Responsible user/team where authorized.
Due date	Task/request due date.
Design status	Current Architecture-owned work state / linked task state.
Review	Linked review/approval state.

- Sales creates the request linked to client/unit; Architecture receives the design work.
- Architect prepares the required package and submits it for review.
- Sales may use only approved floor plans/materials.

20.2 Client Customisations

- Architecture sees the requested design change, project/unit context, design feasibility inputs and Architecture decision/work state.
- Engineering, Finance and Legal actions remain in their owning domains and are shown only as permission-safe status/relationship projections where required.
- No client change proceeds to construction before required approvals and client acceptance.

Privacy boundary

Client Requests must not turn the Architecture role into a CRM view. Show only client/unit/request data required for the design workflow and permitted by authorization.

21. Documents and Transit

Surface	Architect behavior
Documents	Open authorized Architecture/project documents using the shared Documents module.
Tranzit	Project collaborative temporary workspace for drafts/working files; not final or officially issued by default.
Revision History	Open controlled revision history and comparison.
Comments / Mentions	Use document collaboration permissions and parent-record visibility.
Promotion	Move/promote approved working material from Tranzit to the appropriate official folder while preserving identity/history.

- A file may appear through references/shortcuts without duplicating the underlying document.
- Architecture dashboard must never create a separate file store.
- Official file state, revision history and document permissions remain authoritative in Documents.

22. BIM / 3D

```

Project -> Building -> Block -> Floor -> Zone -> Unit -> Room -> Model Element
|
+--> Drawings / RFIs / Tasks / Inspections / Documents / Timeline

```

- BIM/3D opens in the current Project Architecture context.
- Selecting an object may expose linked drawings, RFIs, tasks and other permitted project records.
- The model is navigation, not authority; canonical records remain in source modules.
- Model layers and object data are permission-aware.

23. Tasks and Calendar

23.1 Tasks

- Architecture dashboard projects assigned/participating design tasks from the Tasks module.
- Tasks may carry project, document, meeting, approval and other linked context without duplicating those records.
- Task visibility remains participant/permission based.
- Tasks page may provide List, Board, Calendar and Timeline layouts according to Tasks PRD; the Architect dashboard itself does not duplicate those layouts.

23.2 Calendar and Meetings

- Calendar displays the Architect agenda and project time projections.
- Meetings owns meeting records, agendas, attendance, minutes and decisions.
- Meeting action items convert to Tasks while retaining meeting linkage.
- Dashboard Upcoming is a compact projection only; Calendar remains the authoritative scheduling surface.

24. Data Ownership and Source-of-Truth Boundaries

Domain	Owns	Architect Dashboard responsibility
Projects	Project identity, structure, membership and project status/context	Display authorized project context and deep-link.
Documents / Drawing coordination	Files, revisions, controlled drawing/document state, RFI/submittal content where defined	Display summaries, previews/links and action cues.

Domain	Owns	Architect Dashboard responsibility
Tasks	Task responsibility, participants, status, due dates, checklists and task activity	Project actionable task projections.
Approvals & Workflow	Routing, work items, decisions, delegation, SLA and escalation	Show assigned decisions/status; never duplicate workflow runtime.
Calendar / Meetings	Agenda/time projections; meeting records and minutes	Show Upcoming and links.
CRM / Units	Client relationship and unit identity/status	Expose only design-request context required and authorized.
BIM	Model records, model versions, object identity and spatial relationships	Provide navigation into linked operational records.

Permanent ownership rule

Modules may display each other's data, but they must not create independent editable copies of another module's source records.

25. Authorization and Permission Behavior

- Assigned projects are the default Architect scope; additional project access requires explicit effective authorization.
- Every dashboard cue, count, project card, inbox item, activity item, field and deep link is backend permission filtered.
- Frontend hiding is never sufficient security.
- Architecture role does not receive unrelated Finance, HR, Legal or Sales data merely because records are linked to the same project.
- Restricted relations may be absent or rendered as a minimal locked relation only where platform policy permits.
- Explicit deny and field-level restrictions override ordinary grants.

25.1 Personal dashboard isolation

Dashboard Context = tenant + company + authenticated user + active role + project scope

No cached dashboard state, project selection, counts, activity or preferences may cross users, companies, tenants or stale authorization versions.

26. Platform Configuration

- The approved sidebar items, dashboard regions and permitted quick-create entries support Platform Configuration enable/disable behavior.
- Disabled elements disappear from navigation, search shortcuts and layout without leaving blank gaps.
- Configuration cannot grant permission, bypass workflow, alter source ownership or create unapproved dashboard widgets.
- Users cannot rearrange dashboard widgets in v1.

27. Frontend Architecture

Component	Purpose
ArchitectShell	Persistent Architecture header, sidebar and active context.
ArchitectDashboardPage	Fixed dashboard composition.
ArchitectPrimaryCues	Four exact cue cards.

Component	Purpose
ArchitectProjectCards	My Projects region.
ArchitectWorkInbox	Needs My Attention projection.
ArchitectDesignStatus	Compact source-status summary.
ArchitectUpcoming	Deadlines/reviews/meetings projection.
ArchitectRecentActivity	Permission-filtered recent events.
ArchitectProjectsPage	All Assigned Projects.
ArchitectProjectWorkspace	Project-scoped tab shell.
ArchitectQuickCreate	Authorized context-aware create menu.

27.1 State and routing requirements

- Active company, active role and selected project are explicit application context.
- Shared routes render inside ArchitectShell when Architecture is the active role.
- Project context changes cancel stale project requests and prevent late responses from overwriting current scope.
- Canonical source routes are preferred; role context controls the shell rather than duplicating pages.

28. Logical API / Read-Model Contract

Logical endpoint / capability	Response responsibility
GET Architecture Dashboard	Four cues, My Projects summary, Needs My Attention, Design Status, Upcoming, Recent Activity.
GET Architecture Projects	Permission-filtered assigned-project portfolio.
GET Project Architecture Overview	Project-scoped summary for workspace Overview.
GET Architecture Work Inbox	Action projections with source module/record/stage/due metadata.
GET Architecture Activity	Permission-filtered project/role activity projection.
Source module APIs	Record details and all mutations for drawings/documents, RFIs, revisions, submittals, tasks, approvals, meetings and client requests.

- Backend derives authenticated user and tenant/company authorization context; clients must not be trusted to supply identity.
- Read models contain stable source references and timestamps/freshness metadata.
- Dashboard APIs never become writable business record stores.

29. Responsive UX and Motion

Surface	Required behavior
Desktop	Persistent/collapsible sidebar, wide project-card area, Work Inbox beside/after project portfolio, compact status summaries.
Tablet	Collapsible sidebar; project cards reduce columns; project tabs scroll horizontally only where necessary.
Mobile	Drawer/bottom navigation pattern per platform shell; Work Inbox moves before project cards; cue cards become compact; project tabs use compact switcher.

- Light visual baseline, dark-grey typography, restrained gold/company accent and clear spacing hierarchy.
- Use shared component library; no Architecture-only visual language.

- Motion is restrained and reduced-motion preference is respected.
- WCAG 2.1 AA baseline; status is never communicated by color alone.

30. Empty, Loading, Error and Partial Failure States

State	Required UX
No assigned projects	Explain that no projects are currently assigned/authorized; do not show all company projects.
No attention items	Positive empty state: no current action required.
No drawings/RFI's/etc.	Contextual empty state with create action only when authorized.
Loading	Skeletons match final geometry; preserve shell and selected project.
Partial failure	Healthy regions remain usable; failed region identifies retry without fabricating zero values.
Access revoked	Remove inaccessible content immediately, clear stale state and show permission-safe result.
Source unavailable	Show source-unavailable state; never use stale data as if current without a freshness indicator.

31. Performance, Freshness and Caching

- Typical authenticated dashboard initial load target: ≤ 2.5 seconds on supported broadband under normal operating conditions.
- Key dashboard API reads target p95 ≤ 500 ms excluding heavy files/models/reports.
- Use project/role-scoped read models for dashboard summaries; do not calculate every count from raw records on the client.
- Cache keys must include tenant, company, user/effective authorization, active role and project scope as applicable.
- Permission revocation invalidates relevant cached projections and search/notification access.
- BIM model performance follows BIM-specific streaming/LOD requirements and is not part of dashboard initial-load blocking.

32. Audit, Security and Observability

- All mutations occur through source modules and retain their source audit requirements.
- Workflow decisions are immutable and source finalization is traceable.
- Dashboard and project workspace must not expose restricted record content through counts, tooltips, search, notifications or activity text.
- Log authorization failures, stale-context suppression, projection refresh failures and source-module partial failures using tenant-safe diagnostics.
- No cross-tenant, cross-company or cross-user dashboard data leakage is acceptable.

33. Notification Behavior

- Notifications deep-link to the permitted source record inside the active Architecture shell.
- Architecture-relevant examples include drawing/revision submission, RFI assignment/answer/overdue, submittal decision, required signature, task changes and client design requests.
- Notification delivery never grants record access and must stop when access is revoked.
- Duplicate event noise should be grouped/de-duplicated according to Notification/Event Centre policy.

34. Testing Strategy

34.1 Unit / component tests

- Exact four cue definitions and click-through filters.
- Project card and Work Inbox sorting/empty states.
- Design Status mapping to source statuses.
- Permission/configuration-hidden reflow.
- Quick Create option resolution.

34.2 Integration tests

- Projects assignment and project-scope filtering.
- Documents/drawing current revision and supersession state.
- RFI/submittal source-link reconciliation.
- Tasks Work Inbox projection.
- Approvals work item and source-finalization state.
- Calendar/meeting Upcoming projection.
- Client floor-plan/customisation request flow.
- BIM object links to authorized drawings/RFIs/tasks.

34.3 Security / context tests

- Architect never sees unassigned project data without explicit access.

- Architecture shell persists on shared Project, Task, Document, Client, Meeting and Approval routes.
- Direct URLs, refresh, notifications, recent items and global search preserve Architecture role context.
- Role switch changes shell explicitly; opening a module never changes role.
- Cross-user, cross-company and cross-tenant negative isolation tests pass.
- Unauthorized Finance/HR/Legal/client fields are absent from API responses.

35. Acceptance Criteria

ID	Acceptance criterion
AD-AC-01	Architect login opens the fixed Architecture Dashboard and Architecture shell.
AD-AC-02	Dashboard contains exactly the approved regions: Primary Cues, My Projects, Needs My Attention, Design Status, Upcoming and Recent Activity.
AD-AC-03	Primary cues are exactly Active Projects, Pending Drawings, Open RFIs and Revisions Awaiting Approval.
AD-AC-04	Only authorized/assigned projects appear by default.
AD-AC-05	Project card opens the Project Architecture Workspace without leaving Architecture shell.
AD-AC-06	Project workspace tabs match this PRD and preserve project context.
AD-AC-07	Needs My Attention reconciles with Tasks/Workflow/source records and never stores duplicate work state.
AD-AC-08	Drawings clearly distinguish Draft/current-approved/superseded states from authoritative source data.
AD-AC-09	RFI counts and project RFI lists reconcile.
AD-AC-10	Revision comparison/history remains source controlled and prior versions are preserved.
AD-AC-11	Submittal and approval status uses authoritative source/workflow state.
AD-AC-12	Floor-plan request supports Architecture receipt, package preparation and review handoff.
AD-AC-13	Client customisation does not expose unrelated Sales/Finance/Legal data.
AD-AC-14	Documents and Tranzit use shared Documents storage with no duplicate file copy.
AD-AC-15	BIM is navigation only and opens linked authoritative records.
AD-AC-16	Tasks and Calendar are shared source modules; dashboard shows projections only.
AD-AC-17	Opening any shared module preserves Architecture header/sidebar/active role.
AD-AC-18	Permissions are enforced on backend responses, fields, counts, deep links and activity.
AD-AC-19	Disabled features reflow cleanly with no dead links or blank spaces.
AD-AC-20	Desktop, tablet and mobile layouts remain usable and WCAG 2.1 AA compliant.
AD-AC-21	No dashboard data crosses users, companies, tenants or stale authorization contexts.
AD-AC-22	No unapproved dashboard widget or sidebar item is present.

36. Explicitly Not Allowed

- Additional Architect dashboard KPI cards, charts or widgets not defined in this PRD.
- A generic company KPI dashboard inside Architecture.
- Finance, payroll, legal or sales pipeline widgets on the Architect Dashboard.
- Showing all company projects to an Architect solely because they are in the same company.
- Duplicating Projects, Documents, Tasks, Workflow, Calendar, CRM or BIM business records in Architecture storage.
- Hard-coded role checks that replace the platform capability/scope authorization model.
- A shared module changing the user into another role shell.
- User rearrangement of dashboard regions in v1.
- Generic design-progress percentages without a governed metric definition.
- Treating BIM model data as authoritative business state.

37. Definition of Done

1. Exact Architecture sidebar, header and Dashboard layout are implemented.
2. Assigned-project portfolio and Project Architecture Workspace are fully connected.
3. Drawings, RFIs, revisions, submittals, approvals, client requests, Documents, BIM, Tasks and Calendar deep links resolve to authoritative source records.
4. Role/context persistence and permission filtering pass all shared-route and direct-link tests.
5. Dashboard scope lock is respected with zero unapproved elements.
6. Responsive, accessibility, loading, empty, error and partial-failure states pass visual QA.
7. Performance and cache isolation targets pass with representative enterprise data.
8. Security, audit and negative isolation tests pass with zero critical defects.

Final implementation rule

If an element is not defined in PRD_Architect_Dashboard, it does not appear on the Architect Dashboard or Architecture sidebar. New dashboard content requires an approved PRD revision.

Appendix A. Source Alignment Matrix

PRD decision	Source alignment
Assigned projects first	Master PRD Architecture workspace rule: Architects see relevant modules and assigned projects by default.
Four primary cues	PRD_2 Architect Role Center: active projects, pending drawings, open RFIs, revisions awaiting approval.
Drawing packages / approvals / design tasks / submittals / activity	PRD_2 primary operational content for Architect Role Center.
Controlled drawings/revisions/RFIs/submittals	Master PRD Documents, Drawings, Revisions, RFIs and Submittals requirements.
Floor-plan and customisation requests	Master PRD Sales/CRM/Units client request workflow involving Architecture.
Work Inbox	Platform UI/UX Role Center and Work Inbox architecture.
Approvals projection	Approvals & Workflow Engine separation of business record and decision orchestration.
Documents/Tranzit	Documents Module controlled file/revision/collaboration architecture.
Tasks	Tasks Module as common execution layer with linked source context.
Upcoming / Meetings	Calendar owns agenda projections; Meetings owns meeting records.
BIM / 3D	BIM is spatial navigation linked to authoritative records; model is not authority.
Architecture shell persistence	Role Context and Shared Module Navigation PRD.
Fixed layout / no drag-drop	Master dashboard rules and Platform UI/UX baseline.
