

CONSTRUCTION OS

PRD - Finance Dashboard

Company Finance, Spendings and Project Financial Control

Implementation-ready Product Requirements Document for Product, UX/UI, Frontend, Backend, Security, QA and DevOps Teams.

Product purpose: Define the exact Finance role workspace shell, dashboard content, Spendings workspace and first-class Project Finance integration. This PRD converts the confirmed Finance and Master PRD requirements into one locked full-stack dashboard implementation contract.

Field	Value
Document	PRD_Finance_Dashboard
Version	1.0
Status	Implementation-ready role dashboard specification
Primary role	Finance Manager / authorized Finance users
Parent business PRD	PRD_Finance_Module v1.0
Extends	Construction OS Master PRD - Finance, Budgeting, Payments and Spending
Platform alignment	Role Context, Role & Permission Matrix, Platform UI/UX, Reporting & Analytics
Scope	Finance dashboard + Spendings + company/project financial navigation
Date	2026-08-07

Permanent dashboard scope lock

The Finance Dashboard shall contain only the navigation, scope controls, KPIs, dashboard sections, Spendings functions and Project Finance surfaces explicitly defined in this PRD. Developers must not add, infer, duplicate or auto-expose additional dashboard content without an approved PRD revision. Platform Configuration may hide approved elements; it may not create unapproved ones.

Document Control and Source Authority

Authority	Document / Decision	Use in this PRD
Primary	PRD_Finance_Module v1.0	Finance source of truth, dashboard KPIs, accounting, banking, AR/AP, budgets, forecasts, Project/Unit/Contract Finance, APIs, audit.
Primary extension	Construction OS Master PRD - Finance, Budgeting, Payments and Spending	Spending Bill workflow, superior approval, Finance approval, evidence, budget checks, paid status and project updates.
Confirmed dashboard decision	Finance Dashboard revision approved in this workspace	Spending is a primary Finance item. Projects are a first-class Finance dimension with Company Overview, All Projects and Project Finance views.
Platform	Role Context and Shared Module Navigation PRD	Finance shell remains active when shared modules/pages are opened.
Platform	Complete Role & Permission Matrix	Deny-by-default, capability/scope enforcement, backend filtering and user isolation.
Platform	Platform UI/UX Architecture & Premium Design System	Shared shell, light design, role focus, progressive disclosure, responsive and reduced-motion behavior.

1. Executive Purpose

- Make Finance the company financial control center without duplicating Projects, Contracts, Procurement, Units, HR or Documents.
- Expose company-level financial health and project-level financial control in the same Finance shell.
- Make Spendings a primary operational workflow inside Finance, distinct from accounting Expenses.
- Allow authorized Finance users to move from Company Overview to All Projects to a single Project without leaving Finance context.
- Preserve complete traceability from dashboard summary to authoritative Finance and source-module records.

1.1 Final product position

Finance workspace rule

Finance owns monetary records and financial results. Projects provide project identity and operational context. Contracts define obligations. Procurement owns sourcing and purchase-order context. Units own unit identity/availability. Finance consumes those references and records the accounting, payment, budget and cash consequences.

2. Scope and Non-Goals

In scope	Out of scope
Finance role dashboard and exact left navigation	Redefining accounting rules already owned by PRD_Finance_Module
Company Overview / All Projects / Single Project Finance modes	Creating a duplicate Project record or Project lifecycle
Spendings page and Spending Bill lifecycle presentation	Bypassing Workflow Engine or existing approval authority
Project portfolio table and project financial drill-down	Live bank feeds, payment gateways or external ERP integrations
Dashboard APIs/read models and deep links	Full payroll processing or statutory filing integrations
Responsive, permission-safe and isolated dashboard behavior	Arbitrary user-designed dashboard layouts in v1

3. Finance Application Shell

Authenticated Application

- └ Active company context
- └ Active Finance role/workspace context
- └ Finance sidebar + header
- └ Finance Dashboard / Finance pages
- └ Permission-filtered shared/source-module content

- The active Finance role/workspace determines the shell.
- The route determines the page content inside the Finance shell.
- Opening Projects, Contracts, Units, Clients, Suppliers, Documents or other shared content must not switch the dashboard shell to another role.
- Every request must resolve tenant, active company, authenticated user and effective permissions on the backend.

3.1 Persistent Finance header

Control	Required behavior
Company	Shows active company. Company switching follows platform authorization and resets incompatible dashboard state.
Financial Scope	Company Overview / All Projects / one authorized Project.
Period	This Month / Quarter / Year / Custom.
Currency	Company base currency by default; reporting currency only when permitted/configured.
Search	Global permission-safe search.
Notifications	Permission-safe platform notifications.
Profile	Authenticated user and active role/workspace context.

Scope persistence

The selected company, financial scope and period persist while the user navigates Finance pages. They must never leak across users, companies or browser sessions where the authorization context changes.

4. Exact Left Sidebar Information Architecture

FINANCE
Dashboard
Spendings

REPORTING
Financial Statements
KPI Dashboard
Reports
Audit
SETTINGS
Finance Settings

- This is the exact v1 Finance sidebar hierarchy.
- Permission/configuration-hidden items disappear cleanly with no blank gaps or dead links.
- Spendings and Projects remain visually prominent near the top because they are daily operational Finance work.

5. Dashboard Scope Modes

Mode	Purpose	Primary content
Company Overview	Company-level financial control	Company KPIs, Spending Control, Project Financial Portfolio, recent financial activity.

Mode	Purpose	Primary content
All Projects	Portfolio financial comparison	Aggregated project totals + full project finance table.
Single Project	Detailed project financial control	Project KPIs + tabs for Spendings, Budget, Revenue, Expenses, Contracts, Procurement, Invoices, Payments, Units, Forecast and Reports.

5.1 Scope selection

Finance
 [Company Overview] [All Projects] [Select Project ▼]
 Period: [This Month ▼] Currency: [EUR ▼]

- The Project selector lists only projects the current user may access.
- Selecting a project does not open a second finance system. It changes the Finance scope to that Project.
- Deep links may resolve directly into a Project Finance scope while preserving Finance shell and authorization.

6. Company Overview Dashboard

6.1 Company KPI cards

KPI	Required drill-down
Cash Position	Banking / cash balance sources
Revenue	Revenue detail / posted source
Expenses	Expense detail / posted source
Gross Profit	KPI detail + formula/source
Net Profit	KPI detail + formula/source
EBITDA	KPI detail + formula/source
Receivables	AR aging / invoices
Payables	AP aging / supplier invoices
Overdue Invoices	Filtered overdue invoices
Upcoming Payments	Filtered upcoming outgoing/incoming payments as applicable
Budget Usage	Budget vs actual/committed
Forecast Variance	Forecast vs actual
Tax Liabilities	Tax liabilities / periods

KPI integrity

Dashboard KPIs are summaries. They must be reproducible from authoritative Finance records and must deep-link to the records or governed reports that explain the value.

6.2 Spending Control

Widget	Definition / behavior
Spendings This Period	Total value of Spending Bills in the current scope/period that have reached Finance-approved or Paid status. Draft/rejected records are excluded.

Widget	Definition / behavior
Pending Approval	Spending Bills awaiting superior, department/threshold or Finance approval.
Approved for Payment	Finance-approved Spending Bills not yet marked paid.
Paid	Spending Bills marked paid in the selected period.
Over-Budget Spendings	Spending Bills that trigger budget-control exception/extra approval.

Spendings vs Expenses

Spendings is the operational Spending Bill workflow. Expenses is the accounting classification/result. They are related but are not interchangeable and must not be merged into one record type.

7. Project Financial Portfolio - Permanent Company Dashboard Section

Every accessible company project must be represented in the Finance Dashboard through one permission-filtered project financial portfolio. Projects are not a secondary filter; they are a first-class financial dimension.

Column	Meaning / source
Project	Canonical Project identity; click opens Project Finance scope.
Budget	Approved project budget.
Committed	Committed project cost.
Actual	Actual project cost.
Spendings	Finance-approved/Paid Spending Bills allocated to project for selected period/scope.
Revenue	Project revenue.
Profit	Project Finance profit.
Receivables	Project receivables.
Payables	Project payables.
Forecast	Current project forecast.
Cost to Complete	Project cost-to-complete.

7.1 Portfolio interaction

- Default sort may prioritize active projects; user sorting/filtering is allowed without changing the approved column set.
- Clicking a project row or project name switches the Finance scope to that project.
- Portfolio totals must reconcile with the All Projects view for the same company, period and currency context.
- Project identity/status comes from Projects; monetary values come from Finance.

8. All Projects View

8.1 Portfolio summary

Aggregate KPI	Definition
Total Project Budgets	Sum of approved budgets for included projects.
Total Committed Cost	Sum of project committed cost.

Aggregate KPI	Definition
Total Actual Cost	Sum of project actual cost.
Total Project Revenue	Sum of project revenue.
Total Project Profit	Sum of project profit.
Total Receivables	Sum of project receivables.
Total Payables	Sum of project payables.
Total Forecast	Aggregated project forecast.
Total Cost-to-Complete	Aggregated project cost-to-complete.

8.2 Project table

The All Projects view uses the same Project Financial Portfolio columns defined in Section 7 and adds portfolio filtering/sorting. No separate project-finance data model is permitted.

9. Single Project Finance Dashboard

Finance > Projects > [Project Name]
 Company: [Active Company] Project: [Selected Project]
 Period: [Selected Period] Currency: [Reporting Currency]

9.1 Project header

Field	Rule
Project Name	Read from Projects source record.
Project Status	Read from Projects source record; Finance does not edit project lifecycle.
Approved Budget	Finance source.
Financial Health	Presentation of Finance values; must not invent a hidden score unless separately approved.
Period	Inherited from Finance context.

9.2 Project KPI cards

KPI	Source / drill-down
Approved Budget	Budgets
Committed Cost	Project Finance / commitments
Actual Cost	Posted Finance transactions
Spending	Project-allocated Spending Bills
Revenue	Project revenue
Profit	Project Finance
Receivables	AR filtered by project
Payables	AP filtered by project
Cash Flow	Project cash flow
Forecast	Project forecast
Cost-to-Complete	Project Finance

10. Exact Project Finance Tabs

Overview
 Spendings
 Budget
 Revenue
 Expenses
 Contracts
 Procurement
 Invoices
 Payments
 Units
 Forecast
 Reports

Tab	Content ownership
Overview	Project Finance KPIs and summary.
Spendings	Spending Bills allocated to project.
Budget	Approved/actual/committed/remaining/variance and revision history.
Revenue	Project revenue detail.
Expenses	Project-accounted expenses.
Contracts	Finance view of contract obligations, receivables/payables, retention, claims and value impact.
Procurement	Finance view of requisitions/orders/commitments/received/invoices/payments/price variance.
Invoices	Sales and purchase invoices filtered to project.
Payments	Incoming/outgoing payments filtered to project.
Units	Unit Finance for units linked to project.
Forecast	Revenue/expense/cash/profit/AR/AP forecasts and variance to actual.
Reports	Permission-safe project financial reports.

11. Spendings Workspace

Sidebar label: Spendings. Canonical record type: Spending Bill.

11.1 Spendings page views

All Spendings
 My Review
 Pending Superior Approval
 Pending Finance Approval
 Approved for Payment
 Paid
 Rejected
 Drafts
 Over-Budget

11.2 Spending Bill minimum fields

Field	Requirement
Project	Optional/required according to policy; when present links to canonical Project.
Category	Required financial/spending category.
Amount	Required; positive; currency explicit.

Field	Requirement
Currency	Required.
Supplier	Supplier/contractor reference when applicable.
Receipt / Invoice	Evidence attachment required unless approved policy exception.
Submitter	Authenticated creator.
Cost Center	Finance dimension when required.
Budget	Related budget/cost center/project budget context.
Status	Draft / submitted / approval states / approved for payment / paid / rejected.
Approval	Workflow status and decision history.
Payment	Linked Finance payment status/record where applicable.
Transfer Reference	Required when Finance marks paid when applicable.

11.3 Spending Bill lifecycle

```

Draft
  ↓ Submit
Superior / configured department approval
  ↓ Approved
Finance review: category + tax + budget + evidence
  ↓ Approved
Approved for Payment
  ↓ Finance marks paid + transfer reference
Paid
  
```

- A Spending Bill cannot reach Finance review before required superior approval.
- Over-budget or unbudgeted spending triggers additional approval according to configured thresholds/policy.
- Finance approval never silently overwrites the approved budget baseline.
- Paid status updates the related project budget/financial view and linked supplier/contractor timeline where applicable.
- Rejected records remain auditable and are not deleted from history.

12. Spendings and Accounting Integration

Concept	Rule
Spending Bill	Operational request/evidence/approval/payment workflow record.
Expense	Accounting-classified expense resulting from authoritative Finance postings.
Purchase Invoice	Supplier invoice record; may be linked to Spending Bill when applicable.
Payment	Authoritative Finance payment record; Spending Bill may reference it.
Journal	Authoritative accounting posting; Spending Bill does not replace the ledger.
Budget impact	Project/company budget uses Finance-approved/posted monetary records and configured commitment rules.

No duplicate monetary truth

Spendings may orchestrate review and payment preparation, but balances, payments, journals, invoices and financial statements remain authoritative Finance records. The dashboard must link records rather than copy independent editable totals.

13. Budget Integration

Area	Required behavior
Company budget	Company Overview budget usage reflects approved baseline, actual, committed, remaining and variance.
Project budget	Project Finance budget tab shows approved baseline, actual, committed, remaining, variance and revision history.
Spending Bill check	On submission/Finance review, resolve relevant company/project/cost-center budget context.
Over-budget	Flag and route through additional approval; do not silently block or silently approve unless policy says so.
Revisions	Budget changes create revisions; never overwrite approved historical baseline.

13.1 Project financial dimensions

- Company
- Branch
- Department
- Team
- Project
- Building
- Unit
- Vehicle
- Asset
- Custom cost center

Financial dimensions remain separate from the Chart of Accounts.

14. Contracts, Procurement and Units Integration

14.1 Contract Finance

- Contract value
- Payment schedule
- Receivables
- Payables
- Retention
- Guarantees
- Penalties
- Bonuses
- Claims
- Amendment value impact
- Committed amount
- Paid amount

14.2 Procurement Finance

- Purchase requisitions
- Purchase orders

- Committed cost
- Goods received
- Purchase invoices
- Supplier payments
- Price variance
- Procurement reports

14.3 Unit Finance

- Asking/area/balcony price
- Discount
- Tax
- Final contract price
- Reservation deposit
- Installments
- Paid amount
- Remaining amount
- Next due date
- Late amount
- Final settlement
- Unit profitability

Connected ownership

Contracts, Procurement and Units own their business context. Finance owns monetary records and financial consequences. Finance views must use stable references and deep links, not duplicate editable source records.

15. KPI and Calculation Governance

- Every KPI must have a defined formula, scope, period, currency and source records.
- No dashboard KPI may be calculated from client-side hidden rows or incomplete pagination.
- Company Overview, All Projects and Single Project totals must reconcile under the same scope/period/currency.
- Receivable/payable aging and balance summaries must be reproducible from Finance records.
- Posted entries remain immutable; corrections occur through reversal/adjustment/credit/debit mechanisms.

15.1 Dashboard data contracts

Read model	Minimum contents
Company Finance Overview	Company KPIs + Spending Control + project portfolio summary + recent activity.
All Projects Finance Overview	Portfolio aggregate KPIs + project rows.
Project Finance Overview	Project KPIs + linked section counters/summary.
Spending Summary	Status counts/values, over-budget indicators and links.

16. Drill-Down and Navigation Rules

Interaction	Destination
KPI card click	Filtered authoritative Finance page/report.

Interaction	Destination
Project row click	Single Project Finance Dashboard.
Spending widget click	Spending page with matching status/scope filter.
Contract reference	Contract record inside current authorized shell/context.
Unit reference	Unit record or Unit Finance page, permission permitting.
Invoice/Payment reference	Authoritative Finance record.
Project identity	Canonical Project record when user chooses project identity/detail action.

- Dashboard drill-down must preserve company, period and relevant project scope where meaningful.
- A deep link never expands permission. Unauthorized source records return denial or approved locked behavior defined by platform policy.
- Browser back/forward must restore the correct Finance shell and scope without cross-role leakage.

17. Permissions, Scope and User Isolation

Deny by default

No Finance navigation item, dashboard value, project row, Spending Bill, bank account, payroll summary, invoice, payment or report is returned unless the backend confirms the required capability and authorized scope.

Control	Requirement
Tenant isolation	No cross-tenant data under any route/API/cache.
Company scope	Backend validates active company explicitly.
Project scope	Only authorized projects appear in selectors, portfolio tables and drill-downs.
Sensitive finance	Bank accounts, payroll summary and sensitive values respect field policy.
Action authority	View, create, approve, post, reverse, close period and pay are separate capabilities.
Linked modules	Finance access never expands access to Contracts, Projects, Units, HR, Documents or Procurement.
User dashboard state	Cache/store/preferences scoped to tenant + company + authenticated user + active workspace/role + module + authorization version.

18. Platform Configuration

- Finance module enable/disable.
- Page/section/widget/feature/action/workflow/report enable/disable.
- Tax, Loans, Investments, Assets Finance and Project/Unit Finance toggles.
- Spendings may be disabled only by approved Platform Configuration; when disabled it disappears from sidebar, dashboard, search and APIs without gaps.
- Project portfolio columns defined by this PRD are fixed for v1; configuration may hide approved elements but not introduce unapproved ones.

19. UI/UX Requirements

Area	Requirement
Visual	Light mode, dark-grey typography, restrained gold/company accent, clear hierarchy.

Area	Requirement
Desktop	Persistent Finance sidebar, wide dashboard, dense but readable project/finance tables.
Tablet	Collapsible navigation, two-column dashboard, horizontal table scrolling only where necessary.
Mobile	Compact KPI cards, card-based Spendings/transactions, project selector accessible, bottom action sheet for permitted actions.
Motion	120-180 ms card interactions; 220-280 ms drawers; smooth chart/period transitions; no bounce.
Reduced motion	Respect OS/user reduced-motion setting.
Accessibility	WCAG 2.1 AA baseline; no status conveyed by color alone.

19.1 Required visual states

- Loading skeletons matching final geometry
- No company data
- No accessible projects
- No Spendings
- No invoices/payments
- No budget
- No forecast
- Closed fiscal period
- Source module unavailable
- Partial dashboard failure
- Permission denied
- Module/section disabled

20. Frontend Architecture

```

FinanceDashboardPage
├── FinanceShell
├── FinanceScopeBar
├── CompanyOverviewDashboard
│   ├── CompanyKPIGrid
│   ├── SpendingControl
│   └── ProjectFinancialPortfolio
├── AllProjectsFinanceView
├── ProjectFinanceDashboard
│   ├── ProjectFinanceHeader
│   ├── ProjectKPIGrid
│   └── ProjectFinanceTabs
└── SpendingsPage

```

- Reusable source-module pages/components may render inside Finance shell, but must not own the shell.
- Dashboard state uses centralized scope/context state with request cancellation on scope changes.
- Late responses from a previous company/project/user context must not overwrite current state.

21. Backend and API Requirements

Existing Finance APIs remain authoritative. This PRD requires dashboard/read-model endpoints or equivalent contracts that provide the following behavior.

Contract	Requirement
GET /finance/overview	Company Overview KPIs and source links; accepts period/currency/company context.
GET /finance/projects/{id}	Single Project Finance values and deep links.
GET /finance/projects	Permission-filtered project finance portfolio / All Projects read model.
GET /finance/spendings	Permission-filtered Spending Bills with scope/status/period/project filters.
GET /finance/spendings/{id}	Spending Bill detail and workflow/payment links.
POST /finance/spendings	Create Spending Bill draft under authorized company/scope.
PATCH /finance/spendings/{id}	Edit only while lifecycle/policy allows.
POST /finance/spendings/{id}/submit	Submit to configured approval workflow.

21.1 Approval commands

- Approval/decision execution uses the platform Workflow Engine where configured.
- Finance owns the Spending Bill record and its financial state; Workflow owns how the decision is made.
- The dashboard reflects workflow status and may provide authorized decision entry points; it must not reimplement approval logic.

21.2 API enforcement

- Validate tenant/company/project scope
- Validate period/currency
- Validate lifecycle state
- Validate budget/threshold policy
- Validate action capability
- Return permission-filtered fields
- Emit auditable events after committed changes

22. Validation and Business Rules

Rule	Requirement
FIN-DASH-001	Finance shell remains active for Finance users across shared module navigation.
FIN-DASH-002	Only authorized projects appear in Finance scope selector and project portfolio.
FIN-DASH-003	Spendings is a primary Finance item and is not merged with Expenses.
FIN-DASH-004	Spending Bill evidence is required unless an approved policy exception exists.
FIN-DASH-005	Spending Bill cannot reach Finance review before required superior approval.
FIN-DASH-006	Over-budget/unbudgeted spending triggers additional configured approval.
FIN-DASH-007	Paid Spending Bill updates related project financial views without creating duplicate balances.
FIN-DASH-008	Posted finance entries remain immutable.
FIN-DASH-009	Budget revisions preserve prior versions.
FIN-DASH-010	Company/project dashboard totals reconcile for identical scope, period and currency.

23. Audit and Traceability

- Every Spending Bill creation, submission, approval, rejection, Finance approval, payment link and paid status change is audited.

- Every dashboard drill-down retains source record identifiers.
- Every posted journal stores actor, timestamp, source and period.
- Every reversal links to original entry.
- Every budget revision is versioned.
- Every invoice/payment status change and bank reconciliation action is auditable.
- Audit records are immutable and exportable according to platform policy.

24. Performance and Scalability

Target	Requirement
Dashboard initial load	Below 2 seconds under normal enterprise conditions.
Cached drill-down	Target below 200 ms where cached read model is valid.
Project portfolio	Virtualize/paginate for large company project counts.
Finance transactions	Cursor pagination for ledgers, invoices, activity and audit.
Aggregation	Avoid N+1 cross-module aggregation. Precompute governed summaries where needed.
Scope change	Cancel obsolete requests and prevent stale responses from overwriting current context.

25. Testing Strategy

25.1 Unit tests

- KPI aggregation and reconciliation
- Spending status transitions
- Budget exception logic
- Currency/period filtering
- Project portfolio aggregation
- Permission/configuration resolution

25.2 Integration tests

- Projects scope and identity
- Contracts/payment obligations
- Procurement commitments/invoices
- Units/installments
- Documents evidence
- Workflow approvals
- Payments and bank records
- Audit events

25.3 End-to-end tests

1. Finance user opens Company Overview and sees only authorized company values.
2. Finance user switches to All Projects and sees only authorized projects.
3. Finance user opens a project and Finance shell remains active.
4. Authorized user creates Spending Bill with project/category/amount/currency/supplier/evidence.
5. Spending Bill follows superior approval before Finance review.

6. Over-budget Spending Bill receives required extra approval.
7. Finance approves for payment and later marks paid with transfer reference.
8. Paid record updates related Project Finance views.
9. Another Finance user cannot see unauthorized dashboard state or records.
10. Disabled sidebar/dashboard section reflows with no blank spaces or dead links.

26. Acceptance Criteria

ID	Acceptance criterion
AC-01	Finance Dashboard provides Company Overview, All Projects and Single Project scope modes.
AC-02	Spending is a primary Finance sidebar item.
AC-03	Company Overview contains the approved company KPI set, Spending Control and Project Financial Portfolio.
AC-04	Every accessible project appears in the project portfolio; unauthorized projects never appear.
AC-05	All Projects aggregates and reconciles project budgets, commitments, actuals, revenue, profit, receivables, payables, forecast and cost-to-complete.
AC-06	Single Project view shows approved project KPIs and exact project Finance tabs.
AC-07	Spending page supports all approved views and Spending Bill fields.
AC-08	Spending Bill cannot reach Finance review before required superior approval.
AC-09	Over-budget/unbudgeted spending triggers configured additional approval.
AC-10	Paid Spending Bills update related project financial views and retain source traceability.
AC-11	Spending and accounting Expenses remain separate concepts.
AC-12	Projects provide context while Finance owns monetary records.
AC-13	Opening shared/source-module content never switches Finance user into another role shell.
AC-14	Dashboard/server responses enforce tenant, company, project, field and action permissions.
AC-15	Dashboard state/cache never crosses users, companies, roles/workspaces or authorization versions.
AC-16	Every KPI and project total is drillable and reproducible from authoritative records.
AC-17	Responsive desktop/tablet/mobile states are implemented.
AC-18	Reduced-motion and accessibility requirements are respected.
AC-19	Disabled elements disappear cleanly from navigation, layouts, search and APIs.
AC-20	No dashboard/sidebar content outside this PRD appears without approved revision.

27. Explicitly Not Allowed

- Unapproved dashboard widgets, KPIs, charts or sidebar items.
- A separate project-finance database that duplicates Finance monetary records.
- A project route that replaces the Finance shell with Project Manager or other role shell.
- Client-side-only security or hidden unauthorized rows.

- Cross-user dashboard fallback or shared user dashboard instances.
- Editing posted financial entries in place.
- Treating Spendings as the same record type as ledger Expenses.
- Auto-approving over-budget Spending Bills outside configured policy.
- Expanding access to linked modules because the Finance user can see a Finance summary.

28. Definition of Done

- All acceptance criteria pass in automated and manual QA.
- Company, All Projects and Single Project Finance views reconcile under identical scope.
- Spendings lifecycle is connected to approvals, evidence, budgets, payments and project views without duplicate monetary truth.
- Finance shell/context isolation tests pass across users, companies, tabs, deep links and browser navigation.
- Desktop, tablet, mobile, loading, empty, error and disabled states pass visual regression.
- No unresolved critical authorization, financial integrity, audit, data-loss or cross-context defect remains.

Final implementation rule

One Finance workspace. Company control at the top. Spendings as a primary operational workflow. Projects embedded as a first-class financial dimension. Finance remains the financial source of truth; connected modules remain authoritative for their own business context.
